

# Airedale Equipment Provides The Best Value

## The Advantages Of VERTICAL DESIGN

- Unlike under the window units, Airedale units supply conditioned fresh air through a high level top mounted plenum or a ducted ceiling distribution system. This method assures superior air circulation to all parts of the classroom.
- Airedale units only occupy about 1% of the classroom floor space.
- Airedale units can be positioned anywhere in the classroom against an outside wall.
- For renovations, Airedale units can be installed through an existing window to avoid a masonry cut through the exterior wall.
- Airedale units avoid abuses associated with under the window units such as students sitting on the units, books, plants and other items placed on top of the unit and small objects being dropped into the supply air grilles.

## MAINTAINS ARCHITECTURAL INTEGRITY OF THE SCHOOL

Airedale Equipment will not compromise the architectural integrity of your school. We offer a large selection of outside air louvers, which are designed to blend into the outside facade and clear the window sills. For retrofit installations the existing windows can be used to provide outside air, eliminating costly masonry cuts through the outside wall.
